

Water Tracker Application

Staying hydrated is the key to an active brain. While you are busy with your projects and studies, you may forget to keep yourself hydrated. Why not take this scenario as an inspiration and build your water tracker. The water tracker application must include features like setting a target for a day in the form of glasses, based on the user's BMI. The user should be able to log in their consumption and the levels should be updated. Also features like a time-based reminder, with a calm message would be a bonus.

Requirements

- Use React-Native to build the application.
- Store user's data in storage (using redux is optional)
- Try to write clean and readable code with descriptive comments.
- Avoid plagiarism (don't copy the code from any source)
